

# Higgs Boson – Have we seen it?

## Outline

- ❑ The excitement!!
- ❑ What led to this?
  - The challenge and the effort
- ❑ Have we found something new?
- ❑ What the Indians did if any?

# July 4, 2012

- Physicists get excited at times – for what?
- Historic seminar at CERN with simultaneous transmission and live link at the large particle physics conference of 2012 in Melbourne,

... from Melbourne at the Large Hadron Collider

# Media gets excited as well

July 4<sup>th</sup> 2012  
The discovery of a  
new particle

May 2012

New Particle at the Large Hadron Collider

# Finding so far

- ❑ So far we have probed to a scale of  $10^{-19}$  m
- ❑ Basic constituents of matters are all spin  $\frac{1}{2}$  objects (**fermions**)
- ❑ The six basic types of quarks and leptons are arranged in **3** families
- ❑ There are **4** types of interactions. We consider only **3**: **EM, weak & strong**
- ❑ These interactions are mediated through exchange of spin **1** objects (**vector bosons**)

# Evolution of Theory

- ❑ Interaction is explained by exchange of a carrier of force
- ❑ Theory of electromagnetic interaction reformulated during 40's by Feynman, Schwinger and Tomonaga - gauge theory
- ❑ Exchange particle has zero mass  $\Rightarrow$  photons
- ❑ Try to apply gauge theory to other interactions – weak, strong
- ❑ These interactions are short range – weak interaction needs exchange of massive particles; but mass cannot be easily included in theories satisfying gauge invariance

# The Guralnik-Hagen-Kibble-Higgs-Englert-Brout mechanism...

- ❑ These six gentlemen during early 60's came up with an idea which could rescue gauge theory approach to explain electroweak interactions..
  - They, as 3 independent groups, wrote in the same 1964 volume of Physical Review Letters about a mechanism, which gives mass to particles, from different perspectives and each paper made a distinct contribution
- ❑ Physical Review Letters volume 13 (1964):
  - Guralnik, Hagen, Kibble, "Global Conservation Laws and Massless Particles"
  - Higgs, "Broken Symmetries and the Masses of Gauge Bosons"
  - Englert, Brout, "Broken Symmetry and the Mass of Gauge Vector Mesons"

# The Standard Model

- ❑ This idea is incorporated in unifying the theory of electromagnetic and weak interactions by Glashow, Weinberg and Salam
  - ❑ Strong interaction is also explained in terms of gauge theory: Quantum Chromo Dynamics
- ⇒ The Standard Model of high energy physics

Sheldon Glashow

Steven Weinberg

Abdus Salam

# The Standard Model vs experiments

July 2011

- Earlier experiments (particularly the experiments done at the LEP, CERN and Tevatron, Fermilab) have tested the predictions of the Standard Model to a high level of accuracy
- All measurements agree with the predictions which start with a few unknown parameters

The Standard Model is a beautiful theory and arguably one that is most precisely tested

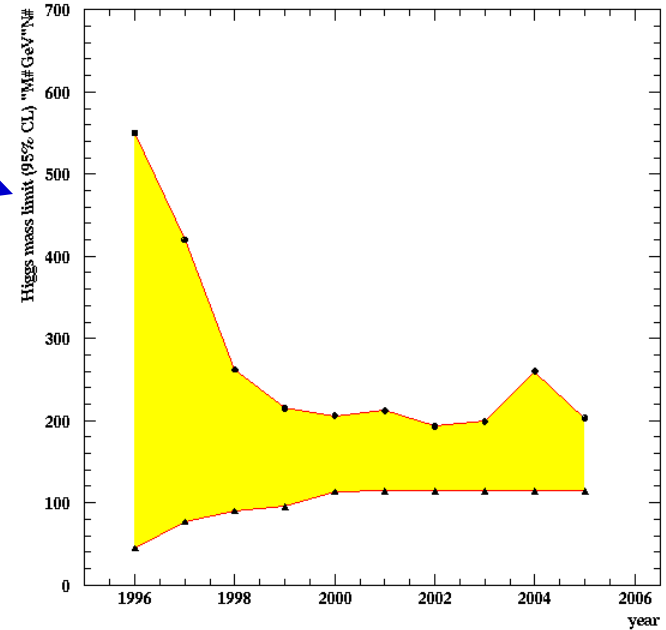

But where is Higgs boson?

# Indirect hints

LEP: indirect determination of the top mass

Prediction for the Higgs mass

Possible due to

- precision measurements
- known higher order electroweak corrections

t' Hooff

Veltman

Banerjee 10

# How to find Higgs boson?

- It has to be produced in interactions
  - Collide particles with sufficient high energy
  - Protons are good choice for the colliding particles
  - Probability of Higgs production is small → need a large number of interactions
- Higgs boson is unstable and will decay to other particles immediately after it is produced
  - Look at all possible signatures
  - Observation in multiple final state can only establish a new object

# The Large Hadron Collider at CERN

- 27 km (17 miles) circumference
- Accelerates beams of protons to 99.9999991% the speed of light

Lake Geneva

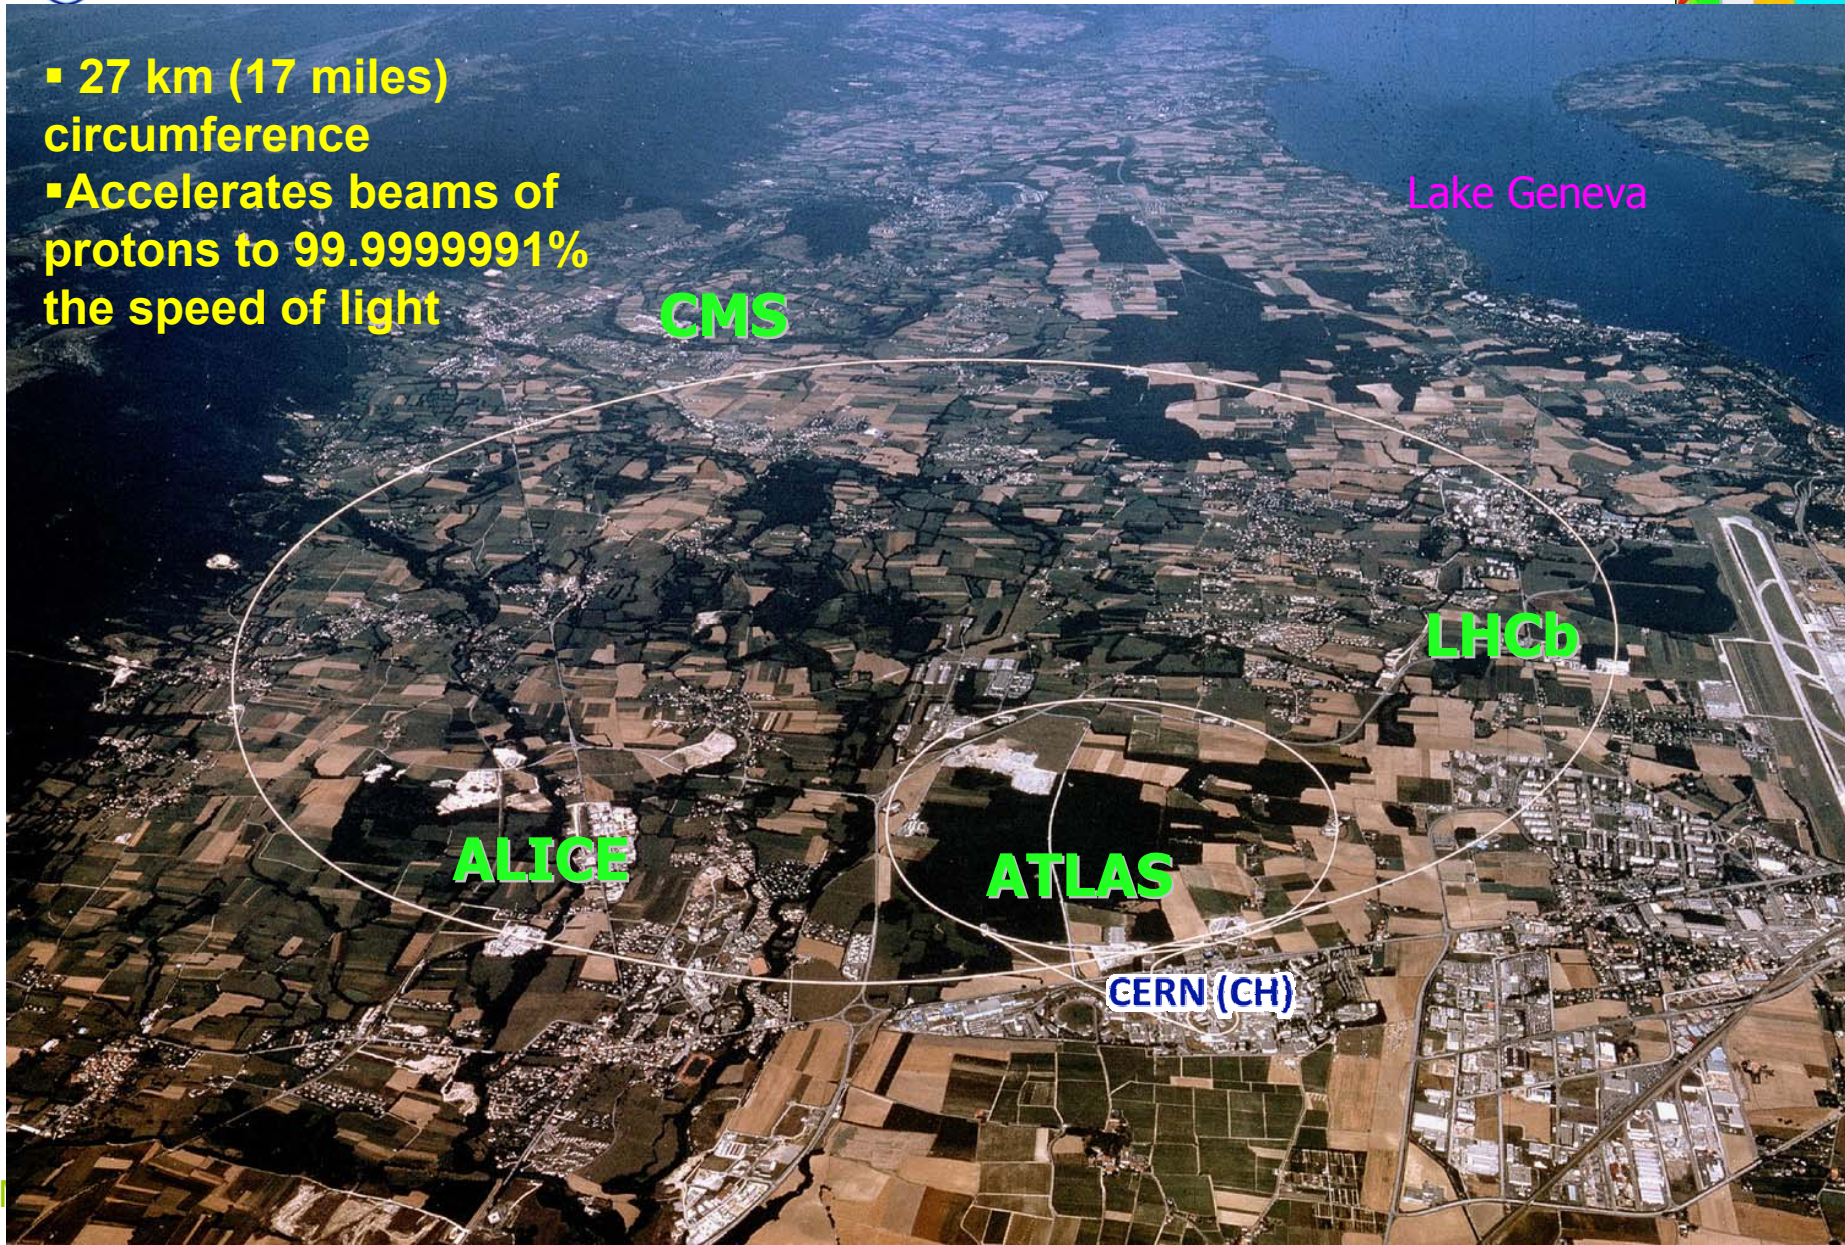

CMS

LHCb

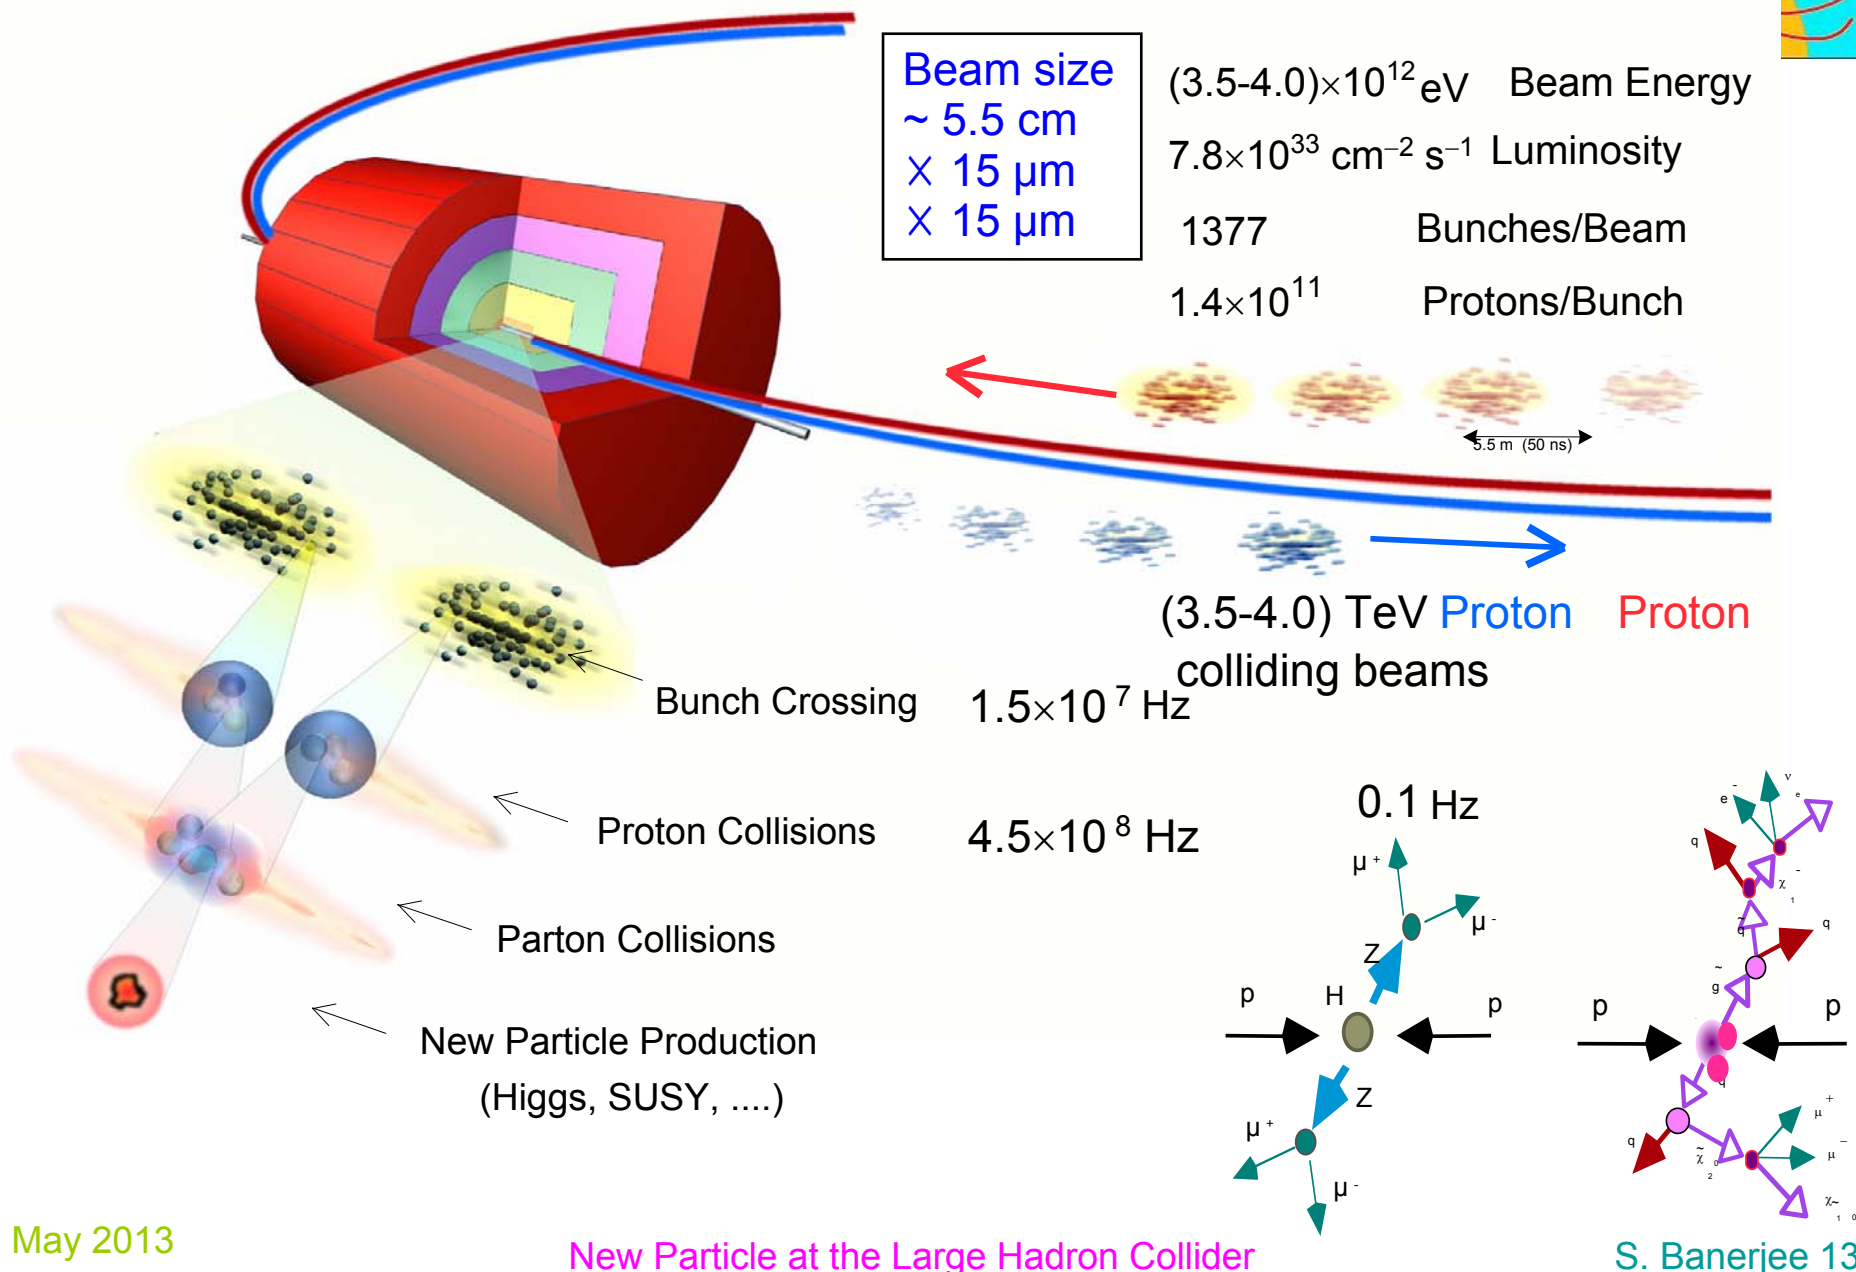

ALICE

ATLAS

CERN (CH)

# Large Hadron Collider

# Facts about LHC

- Energy stored in magnets: 10 GJ = A380 at a cruise speed of 700 km/h. Can heat and melt 12 tons of copper!

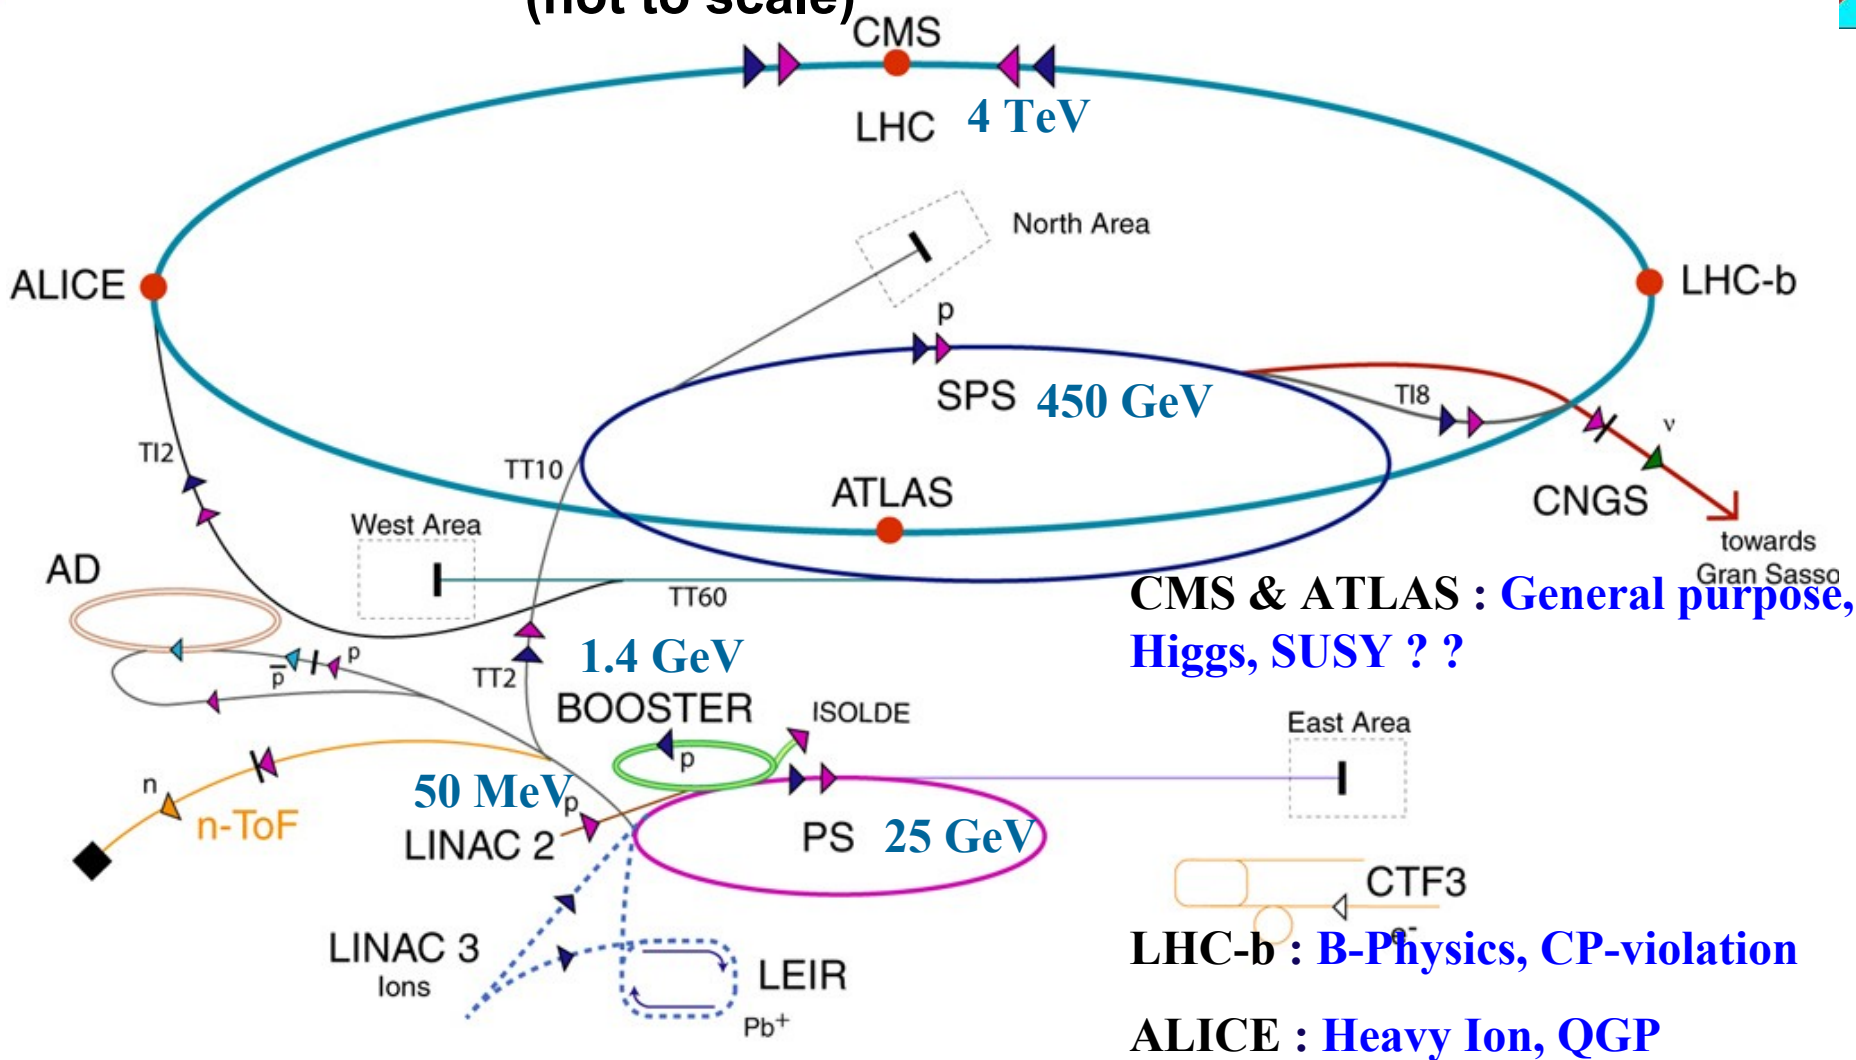

- Energy stored in a single beam: 360MJ is equivalent to 90 kg of TNT or 15 Kg of chocolate
- The amount of liquid helium in the machine is 60 tons or 120 thousand gallons
- LHC is the coldest place within the solar system with the temperature of 1.9°K
- It is also the emptiest place in the solar system with the vacuum in the pipe containing the beams at  $10^{-13}$  atm.

# CERN accelerator complex

- Pixels (100x150 μm<sup>2</sup>)  
~ 1 m<sup>2</sup> ~66M ch
- Si Strips (80-180 μm)  
~200 m<sup>2</sup> ~9.6M ch

**MUON BARREL**  
250 Drift Tubes (DT) and  
480 Resistive Plate Chambers (RPC)

# The CMS collaboration

**A large collaborative effort**

**3600 Physicists, Engineers and students**

**38 Countries**

**182 Institutions**

**Gradually increasing**

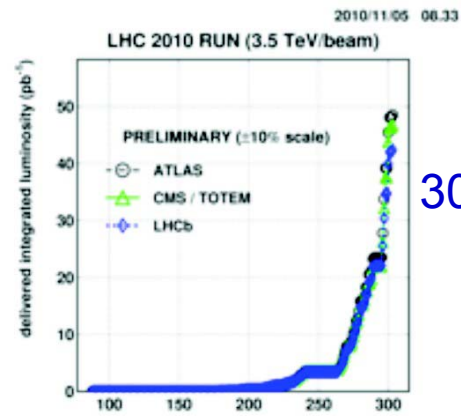

# What may happen

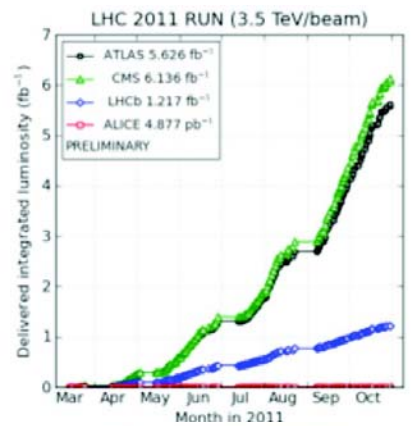

- ❑ Need a large number of interactions to probe at small cross section of the production process
- ❑ LHC was generous for that
  - Provided excess of  $\sim 4 \times 10^{14}$  interactions during 2011 at 7 TeV cm energy and even larger number at 8 TeV during the first half of 2012
  - The experiments collected the provided luminosity with very high efficiency
- ❑ However this will produce  $\sim 10^9$  unwanted interactions for each Higgs boson

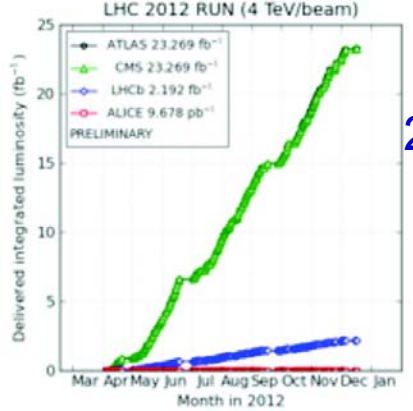

# Success of LHC (Misery to Experiments)

$$L = \frac{kN^2 f}{4\pi\sigma_x^* \sigma_y^*} F = \frac{kN^2 f \gamma}{4\pi\beta^* \varepsilon} F$$

- $k$  = # of bunches
- $N$  = # of p's/bunch
- $f$  = rev. frequency
- $\sigma$  = beam size
- $F$  = geometry loss factor
- $\varepsilon$  = beam emittance
- $\beta$  = betatron function

New Particle at the Large Hadron Collider

# How much data is produced?

☐ Nearly 1 GB of data is recorded every second

- 15,000 TB/year = 15 PB/year
- It's like recording a DVD every 4 sec
- Enough to fill your hard drive in 2 min

☐ Processed all around the world via LHC Computing Grid

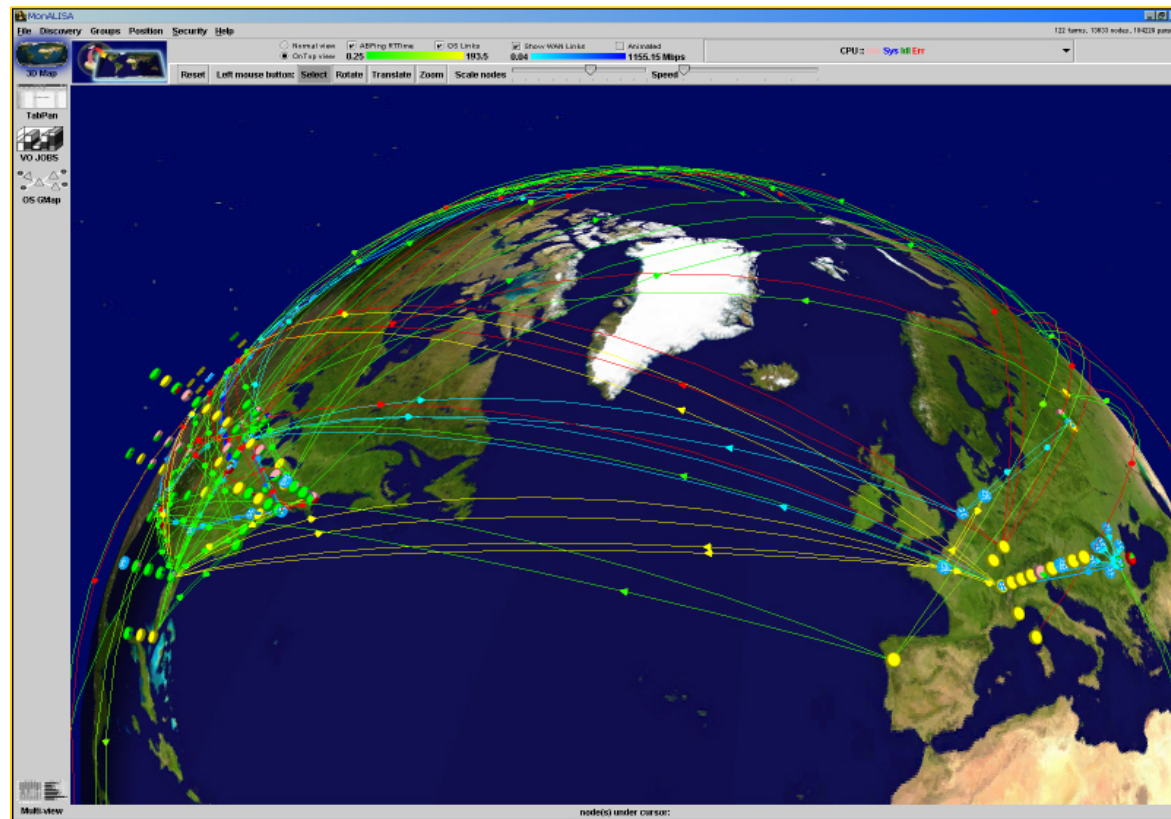

CD stack with 1 year LHC data!  
(~ 20 Km)

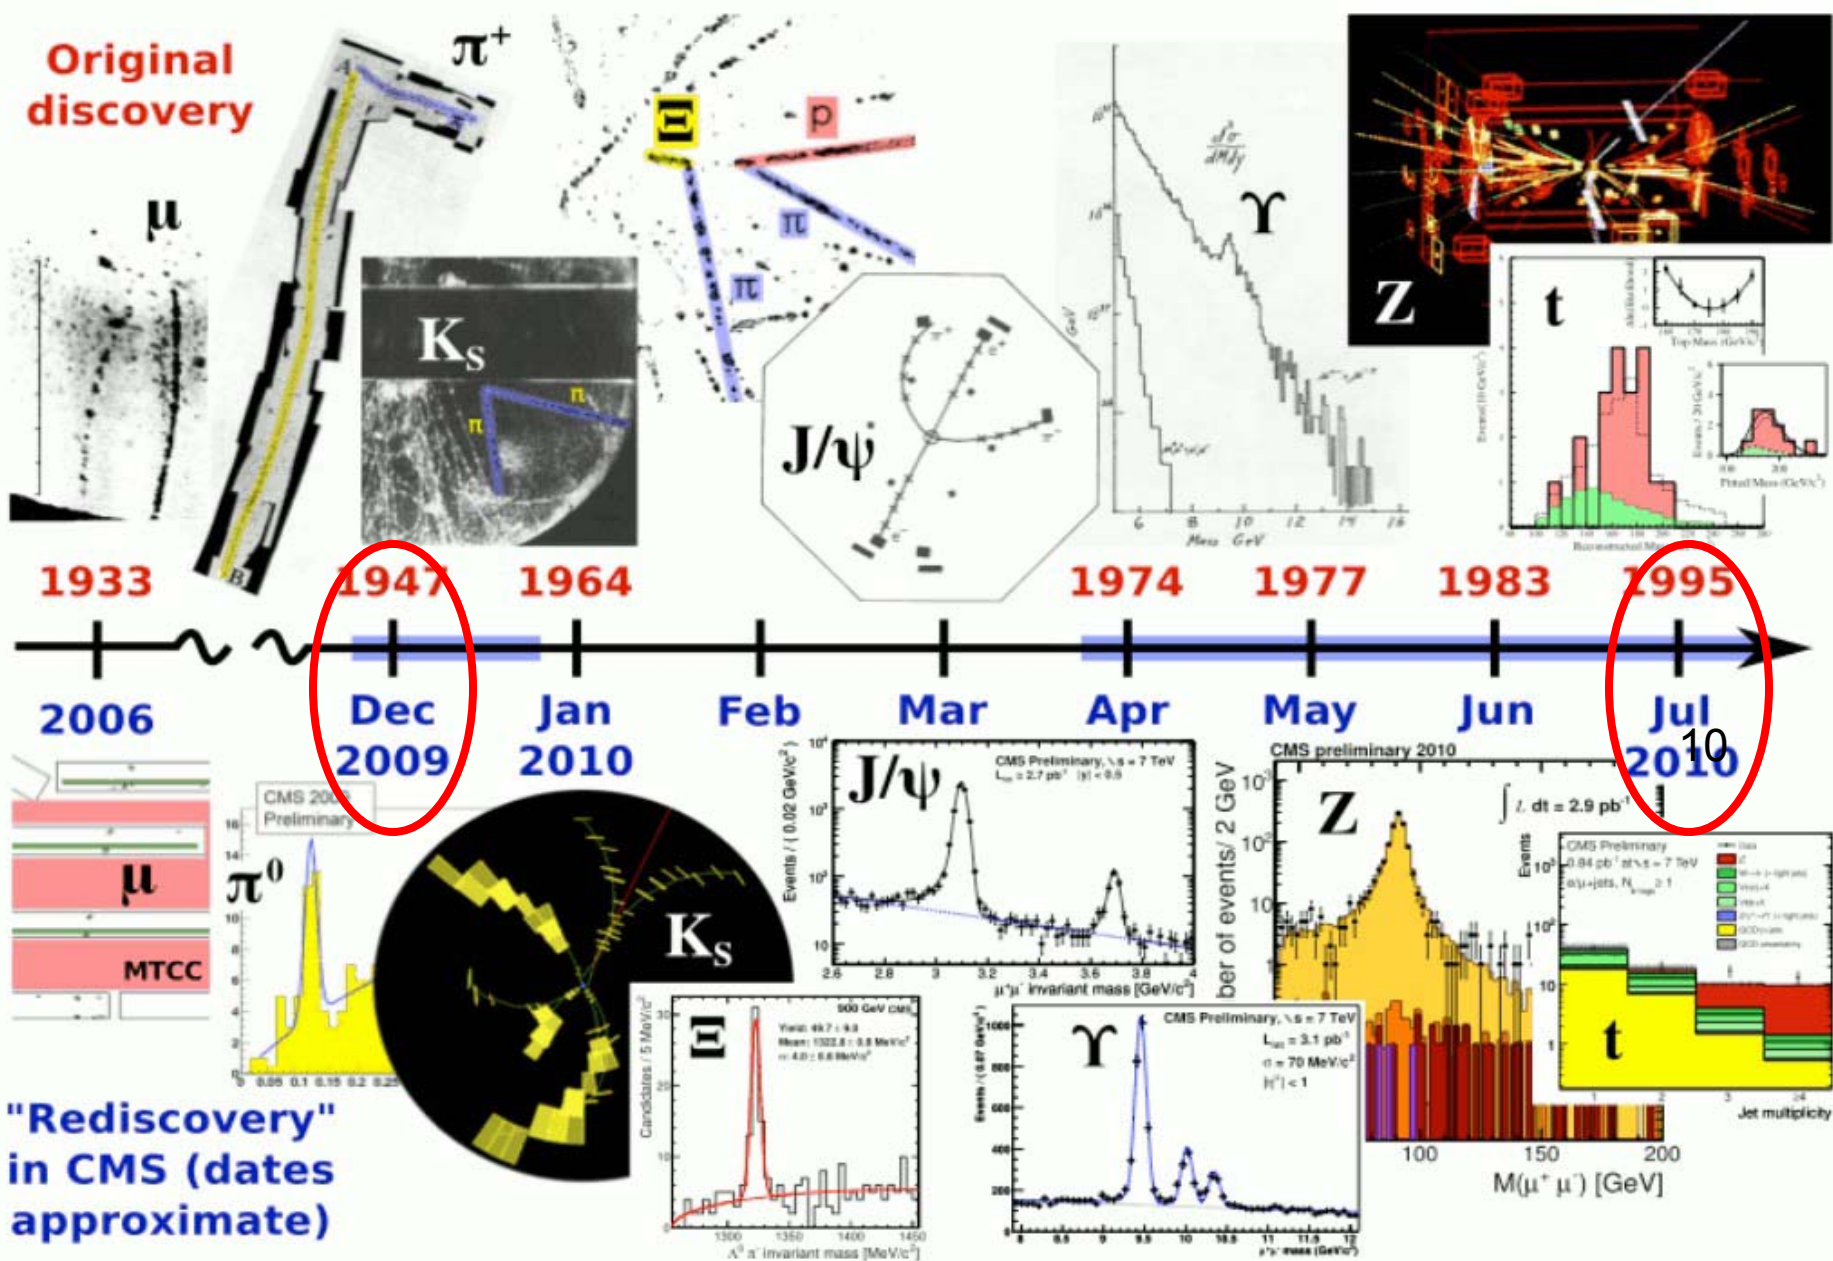

Concorde  
(15 km)

Mont-Blanc  
(4.8 km)

# Understand the detector first

# Standard Model Measurements

- Key point for any new discovery is to understand the backgrounds from SM processes and understanding the detector effects.

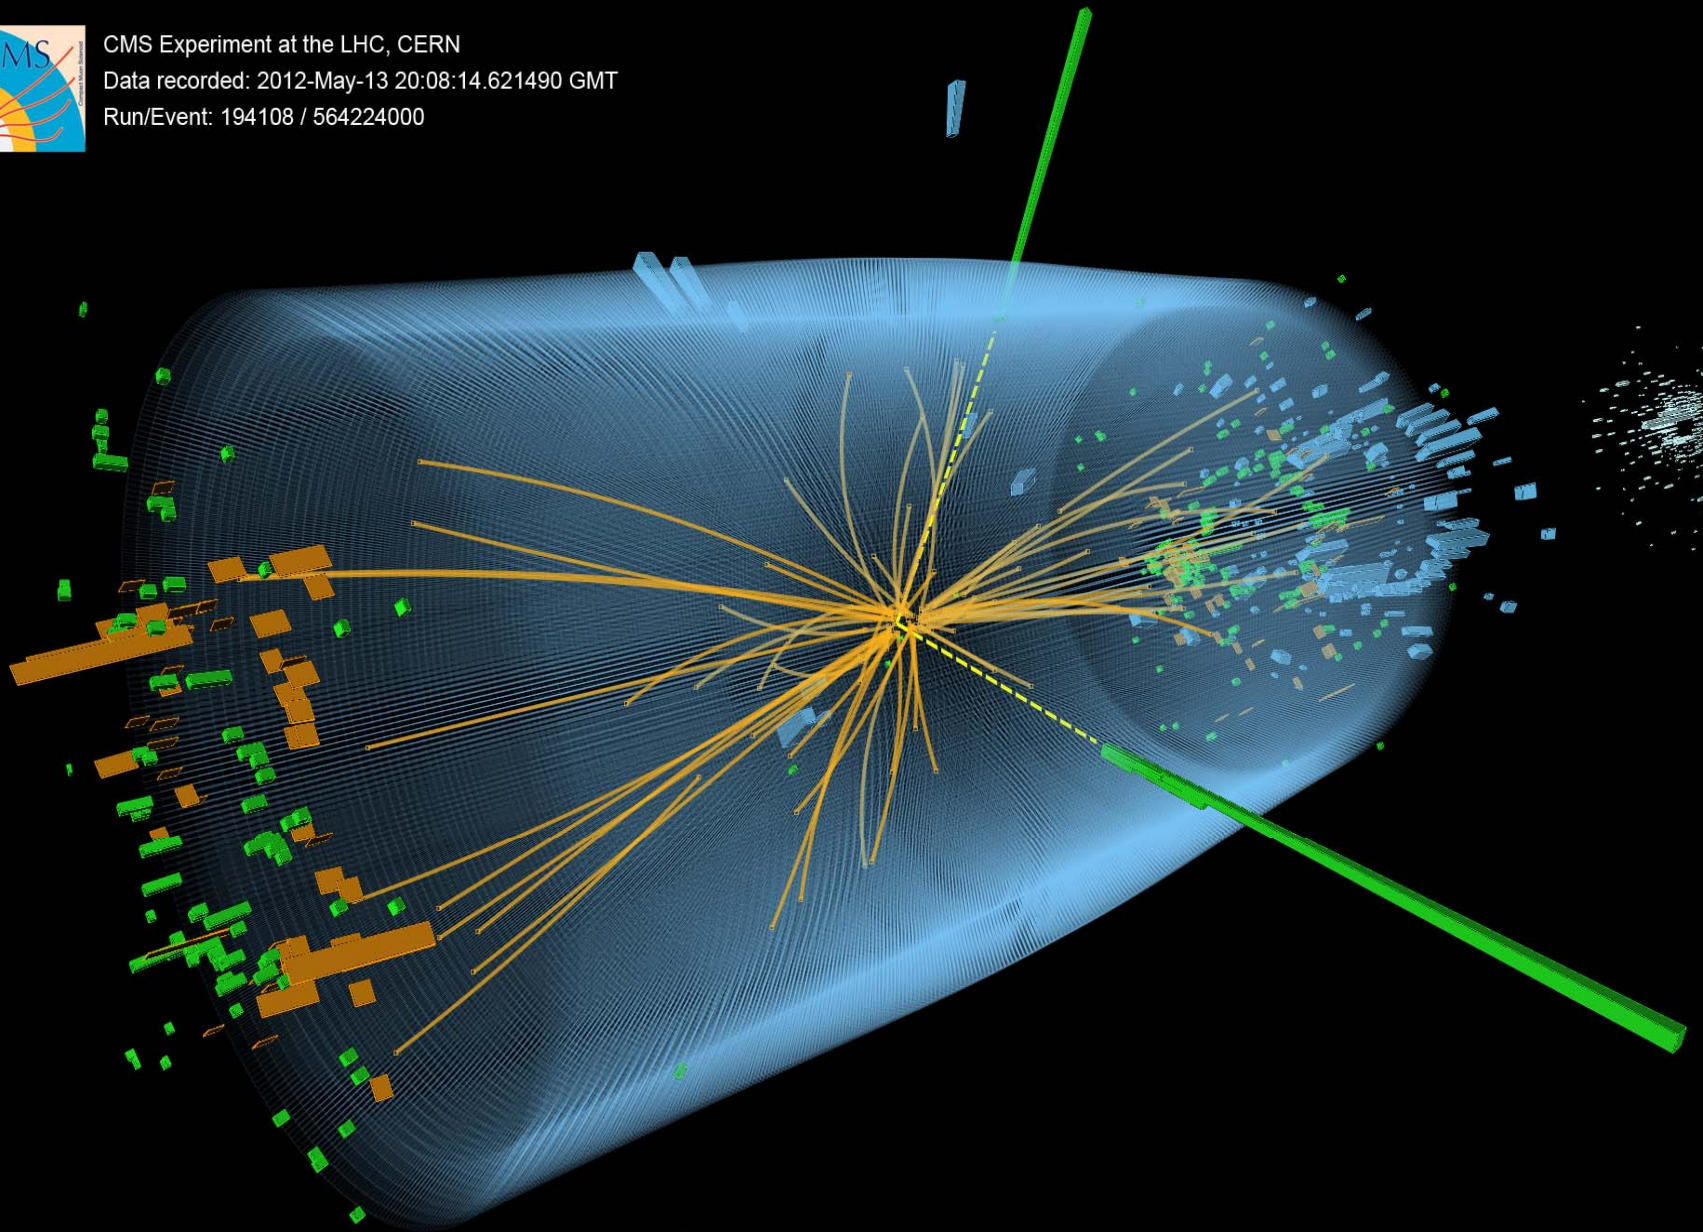

# Candidate event ( $H \rightarrow \gamma\gamma$ )

CMS Experiment at the LHC, CERN

Data recorded: 2012-May-13 20:08:14.621490 GMT

Run/Event: 194108 / 564224000

# Candidate event ( $H \rightarrow ZZ^{(*)} \rightarrow 2e + 2\mu$ )

$\mu^+(Z1) p_T : 43 \text{ GeV}$

8 TeV DATA

4-lepton Mass : 126.9 GeV

$e^-(Z2) p_T : 10 \text{ GeV}$

$\mu^-(Z1) p_T : 24 \text{ GeV}$

$e^+(Z2) p_T : 21 \text{ GeV}$

CMS Experiment at LHC, CERN  
Data recorded: Mon May 28 01:35:47 2012 CEST  
Run/Event: 195099 / 137440354  
Lumi section: 115

# Search

- There are other Standard Model process which may give events with similar signatures
- Evaluate how many such background events will be seen against possible signal events

July 2010

New Particle at the LHC

# Final Results

## ATLAS observes:

- Maximum excess at 126.0 GeV at 5.9  $\sigma$  CL
- Probability of fluctuation  $1.7 \times 10^{-9}$

## CMS observes:

- Excess in 4 different channels at 125.3 GeV
- Level of fluctuation at 5.0-5.1  $\sigma$  CL ( $3 \times 10^{-7}$ )

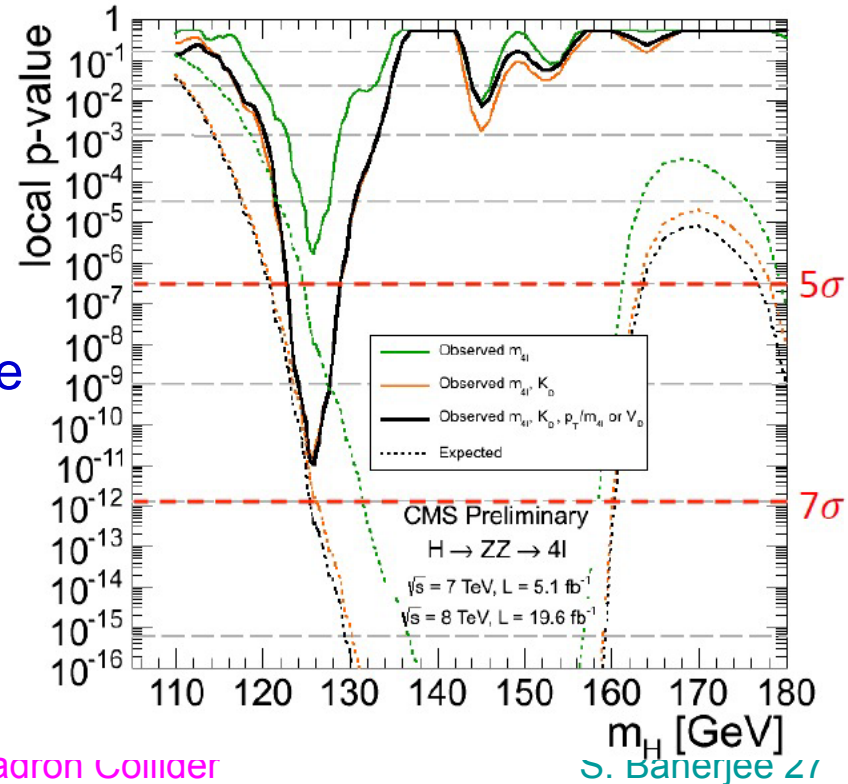

# New Data from CMS

- Significance =  $6.7 \sigma$
- Expected separation  $0^+/0^- \sim 2\sigma$ 
  - Scalar ( $0^+$ ): consistent at  $\sim 0.5\sigma$
  - Pseudoscalar ( $0^-$ ): inconsistent  $\sim 3.3\sigma$
- Rule out  $2^+ \sim 2.7 \sigma$

The new data adds more significance and also some of the empty regions get filled up

# CMS Combined Results

- Significance in  $H \rightarrow \gamma\gamma$  is reduced to  $3.5 \sigma$  expected:  $3.9 \sigma$
- signal strength:  $0.80 \pm 0.14$
- Mass estimate:  $125.7 \pm 0.4 \text{ GeV}$

# New data from ATLAS

- Including  $\sim 21 \text{ fb}^{-1}$  8 TeV data
- Observe  $\sim 10\sigma$  significance
- Mean signal strength:  
 $\mu = 1.30 \pm 0.20$

Compatibility with spin 0

Compatibility with spin 2

- Accurate mass measurement from ZZ and  $\gamma\gamma$  channels:
  - $M = 125.5 \pm 0.2$  (stat)  $\pm 0.6$  (syst) GeV
- Spin is analyzed in a model with unknown Higgs production mechanism (fraction of qq/gg being parameters)
- Exclude  $2^+$  at 99.9% CL; other possibilities at  $> 95\%$  CL

# Mass of the Resonance

□ Z peak into 2 electrons or 2 muons is the main tool for mass scale

# Indian participation in CMS

- ❑ **Participants:** Universities of Chandigarh, Delhi + BARC (Mumbai), SINP (Kolkata), TIFR (Mumbai) (since 1993)
- ❑ **Indian groups participated in**
  - the design of the detectors,
  - building hardware components,
  - contributing to the software and detector performance studies
  - physics analysis leading to the papers for publication
- ❑ **Early design work includes**
  - choice of material for the electromagnetic calorimeter
  - detector granularity to balance resolution vs particle identification

# Hardware contribution

TIFR, together with Panjab University constructed the outer hadron calorimeter

- HO covers central rapidity region  $|\eta| < 1.3$  occupied by the five muon rings to improve jet and MET resolution

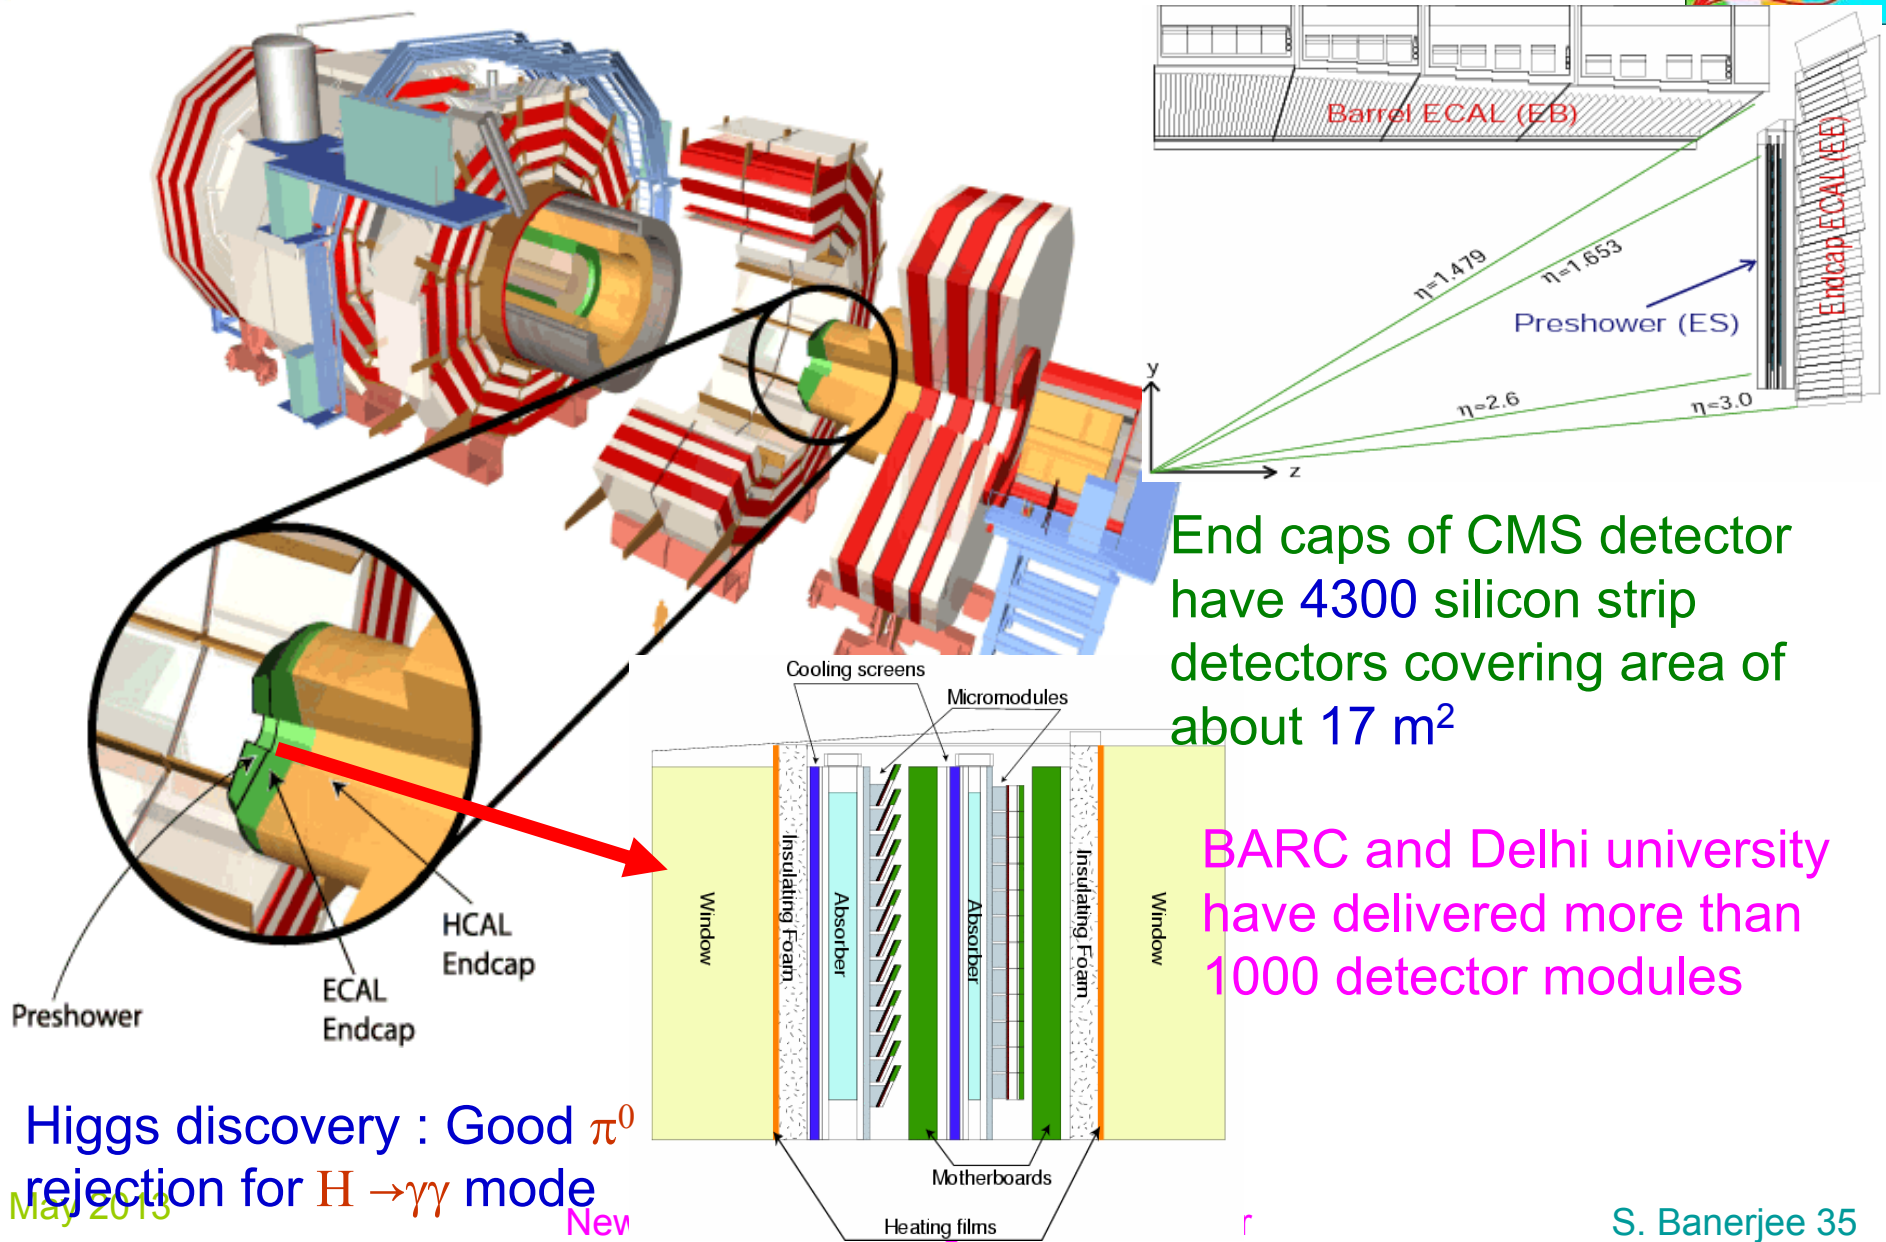

Pseudorapidity,  $\eta = -\log_e(\tan(\theta/2))$

- Basic detector element maps tower granularity of  $0.0873 \times 0.0873$  in  $\eta \times \Phi$
- 432 trays are built from 2730 tiles

SINP, TIFR are now contributing to the upgrade effort of HCAL

# CMS preshower detector

End caps of CMS detector have 4300 silicon strip detectors covering area of about 17 m<sup>2</sup>

BARC and Delhi university have delivered more than 1000 detector modules

Higgs discovery : Good  $\pi^0$  rejection for  $H \rightarrow \gamma\gamma$  mode

# Software contributions

One of the main architects of the offline software project – starting from the very first version of simulation and reconstruction, graduating to object oriented software to the final version which is deployed from HLT to analysis. The first success of LHC experiments is how well and quickly the detectors are understood – largely due to work of a few task forces which were steered by Indian scientists.

- ❑ First designer of web based GUI (Graphical User Interface) for data quality monitoring and coordinating DQM activities of the tracker
- ❑ Prototyping the DAQ system with testing of various high speed switches
- ❑ Development of GRID monitoring tools for CMS
- ❑ Participation in calibration and overall performance of the hadron calorimeter system

# Physics studies

Carried out several analyses leading to public version of the analyses and a number of physics publications:

- Single particle response in the calorimeter
- Event shape distributions at a few CM energies
- Studies of underlying events using jets reconstructed from tracks and using Drell-Yan events
- Direct photon production and constraints on parton density function
- Measurement of subjet multiplicity in dijet events
- Test of QCD in inclusive jet and multi-jet production
- Measurement of W charge asymmetry and  $W\gamma$  production
- Search of Standard Model Higgs boson in a number of channels involving leptons,  $\tau$ 's and  $\nu$ 's
- Quarkonia production in heavy ion collisions
- Search for excited lepton
- Study of mono photon production in view of extra dimension
- Search of Supersymmetry in all hadronic final state

# Last Word

- ❑ There is a very strong evidence of a new narrow boson of mass around 125-126 GeV
- ❑ The search criteria of this object is motivated by Higgs boson within the Standard Model
- ❑ Evidence is slowly growing toward a scalar boson with properties as expected from Higgs boson within the Standard Model
- ❑ This is achieved by international collaboration of thousands of people working over two decades
- ❑ We, the Indians, have been a part of this from very early days

# Back Up

# Nature of interactions

Gravitational → solar system

Electromagnetic → photon

Weak → radioactivity

Strong → binding of nucleus

# Indirect Measurement (Jan 2012)

- Use precision measurements from LEP/SLC/Tevatron measurements and carry out Standard Model fit

New (preliminary) indirect Higgs mass determination

$$M_H = 94_{-24}^{+29} \text{ GeV} \text{ (was } M_H = 92_{-26}^{+34} \text{ GeV before)}$$
